EXPERIMENT-5

ROLL NO: 240701137 NAME: FEMINNA G

USER INTERFACE AND DESIGN

Task Analysis, User Flow Design, and Wireframing for Recipe App

1. Objective

To analyze user tasks for a Recipe Application, document user flows, and design corresponding wireframes using Lucidchart.

2. Problem Statement

Design an application that helps users:

- Find recipes based on available ingredients
- Follow step-by-step cooking instructions
- Save and manage favorite recipes

3. Tools Used

- Lucidchart (for user flow and wireframes)
- Storyboard (for initial concept reference)

4. Task Analysis

Task analysis breaks down what the user wants to achieve into smaller steps.

◇ Primary Task: Find and Cook a Recipe

Subtasks:

1. Open the app
2. Enter available ingredients
3. View suggested recipes
4. Apply filters (time, diet)
5. Select a recipe
6. View step-by-step instructions
7. Save recipe (optional)

◇ Secondary Task: Save and Access Favorites

Subtasks:

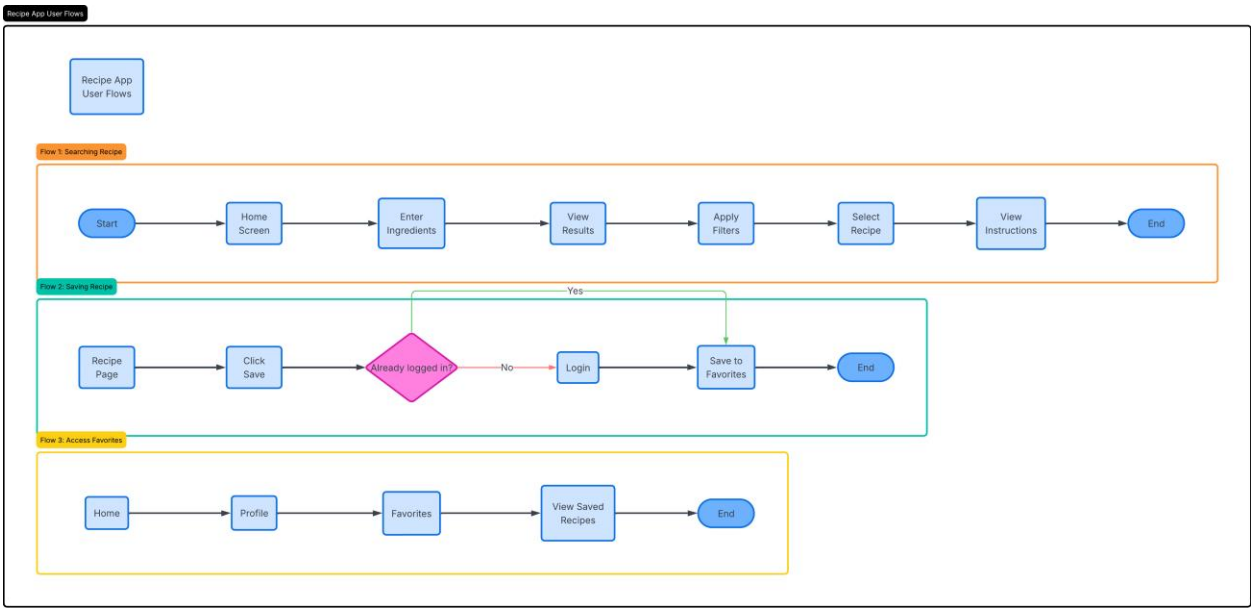
1. Login to account
2. Save a recipe
3. Navigate to favorites
4. View saved recipes

◇ Tertiary Task: Sync and Access Offline

Subtasks:

1. Enable account sync
2. Access saved recipes offline

5. User Flow



◇ Flow 1: Searching Recipe

Start → Home Screen → Enter Ingredients → View Results → Apply Filters → Select Recipe → View Instructions → End

◇ Flow 2: Saving Recipe

Recipe Page → Click Save → Login (if not logged in) → Save to Favorites → End

◇ Flow 3: Access Favorites

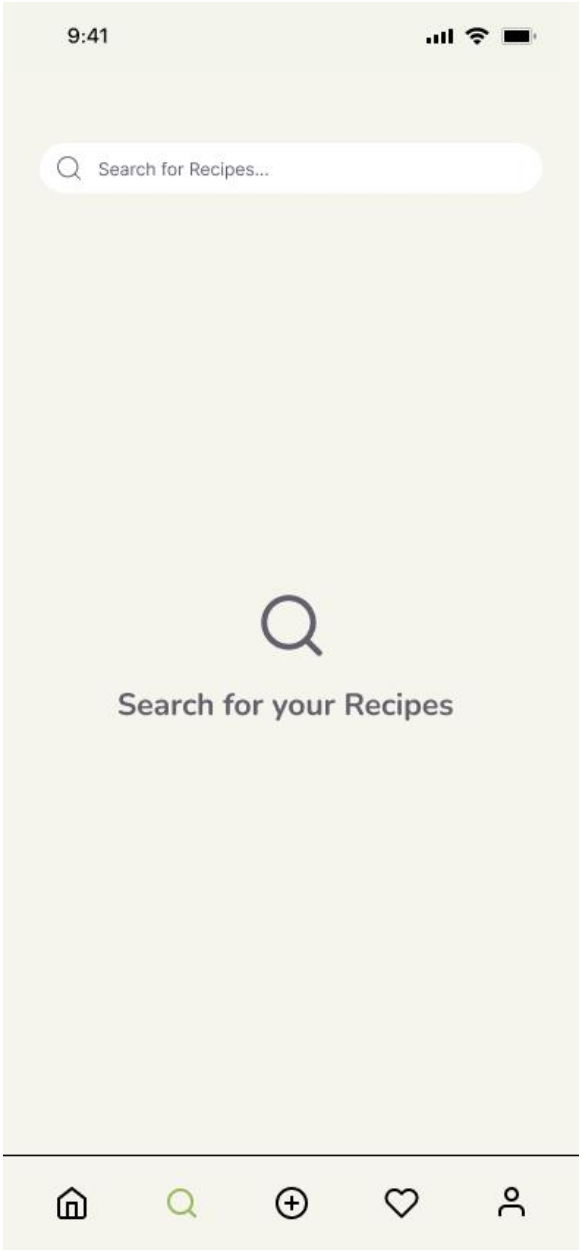
Home → Profile → Favorites → View Saved Recipes → End

6. Wireframes

1. Home Screen

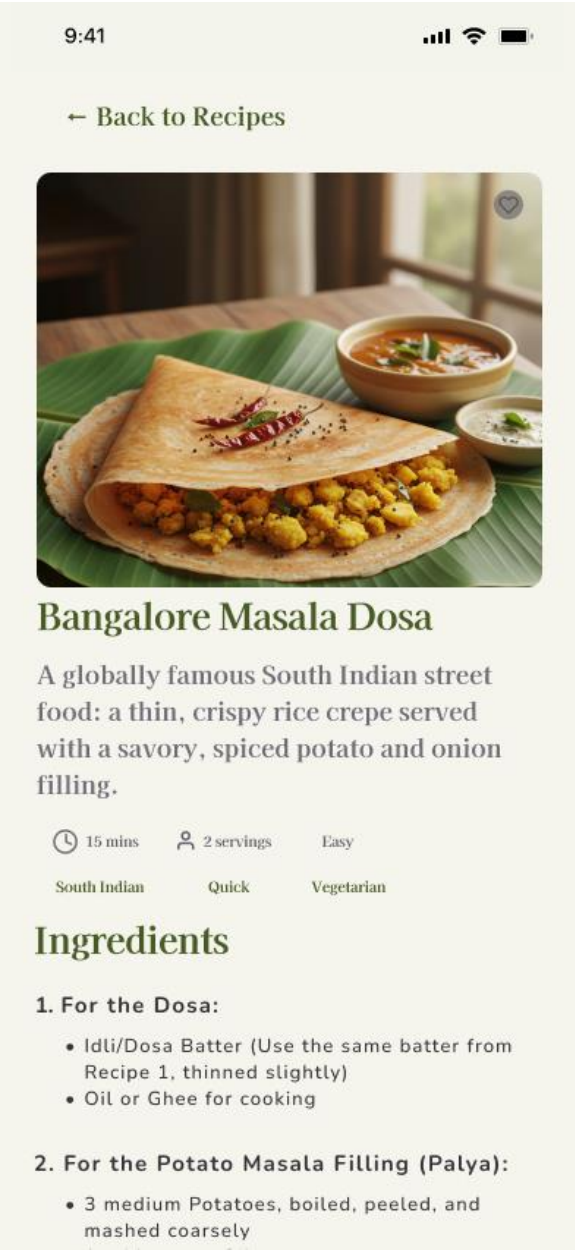
- Search bar (Enter ingredients)
- Quick categories
- Navigation bar

◇ 2. Recipe List Screen



- Recipe cards
- Filters (time, diet, category)
- Scrollable layout

◇ 3. Recipe Detail Screen

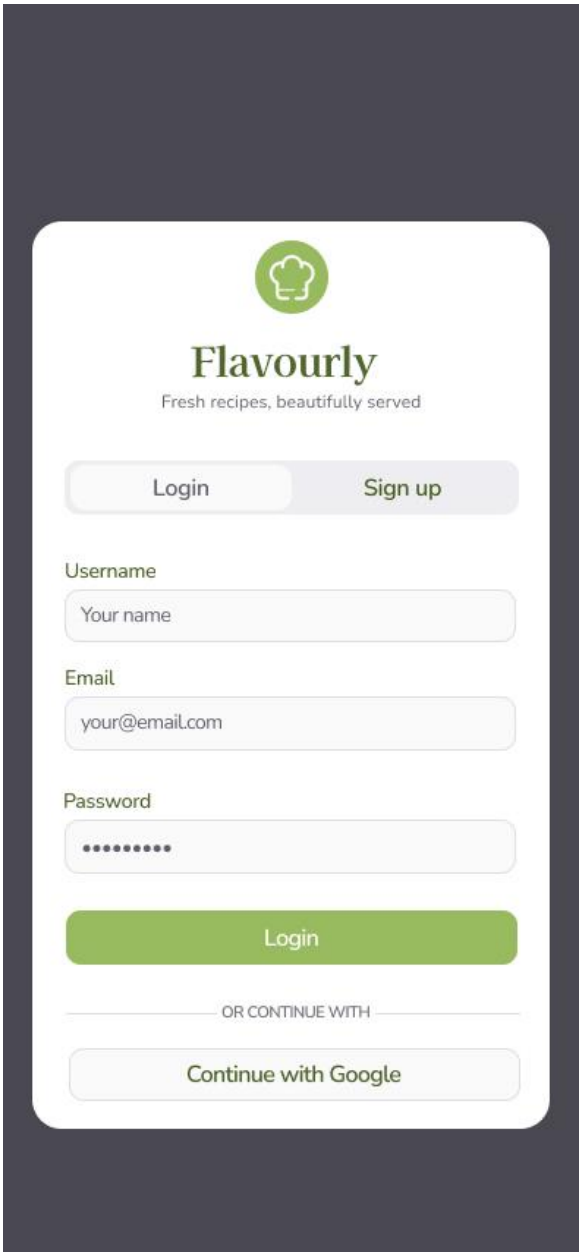


- Recipe image
- Ingredients list
- Step-by-step instructions
- Save button

◇ 4. Favorites Screen

- List of saved recipes
- Option to remove

◇ 5. Profile Screen



- Login/Signup
- Sync settings
- Preferences

7. Procedure

1. Identified key user goals and tasks
2. Broke down tasks into subtasks (Task Analysis)
3. Created user flows representing navigation paths
4. Designed wireframes in figma based on flows
5. Ensured simplicity and usability in design

8. Result

Successfully analyzed user tasks, created user flows, and developed low-fidelity wireframes representing the application structure.

9. Conclusion

Task analysis helped in understanding user requirements in detail. User flows clarified navigation paths, and wireframes provided a clear visual structure for the application design.
