EXPERIMENT-8

ROLL NO: 240701137 NAME: FEMINNA G

USER INTERFACE AND DESIGN

Storyboard and Low-Fidelity Prototype Design for Recipe App

1. Objective

To design and visualize the user flow of a Recipe Application using a storyboard and to create low-fidelity UI prototypes using Balsamiq.

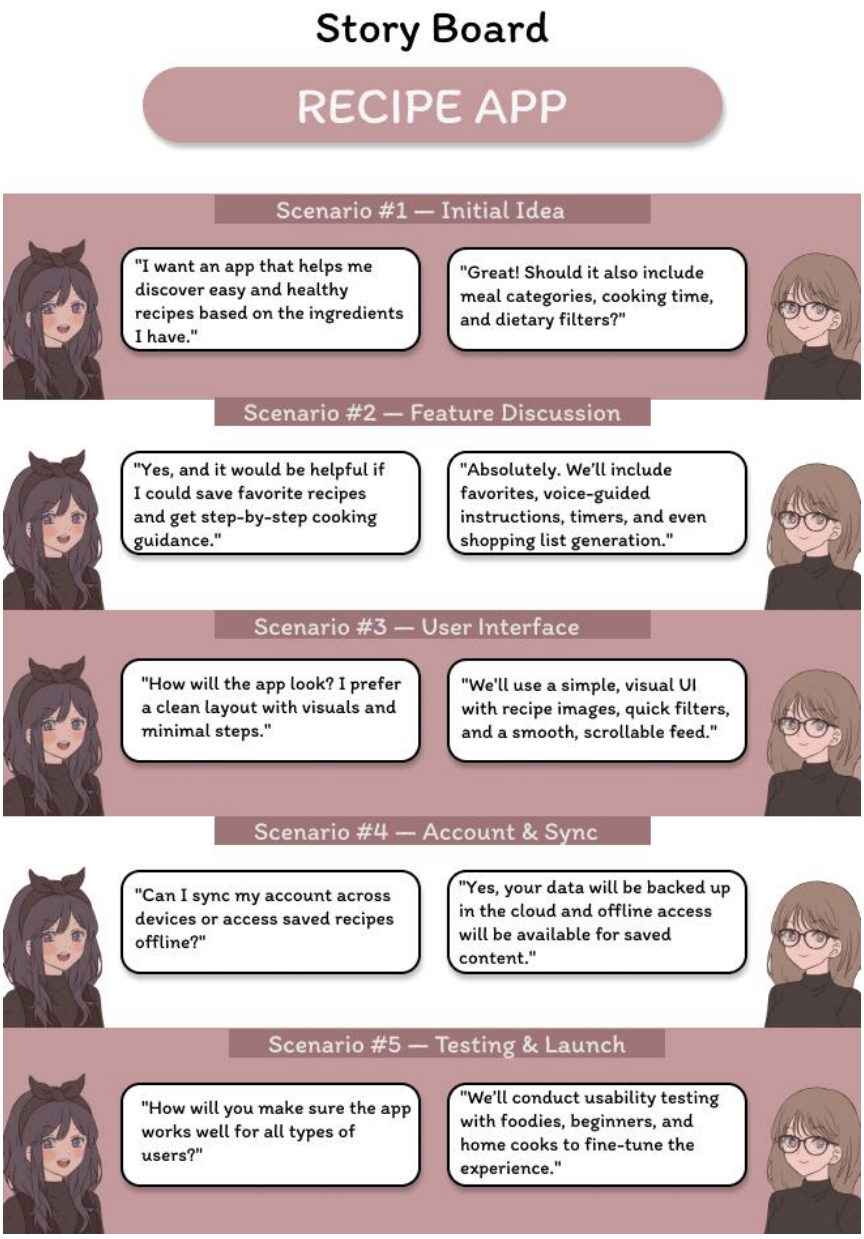
2. Problem Statement

Users need an application that helps them:

- Discover easy and healthy recipes
- Use available ingredients efficiently
- Follow simple cooking steps

3. Tools Used

- Storyboard (manual / digital design)
- Balsamiq (for wireframing)



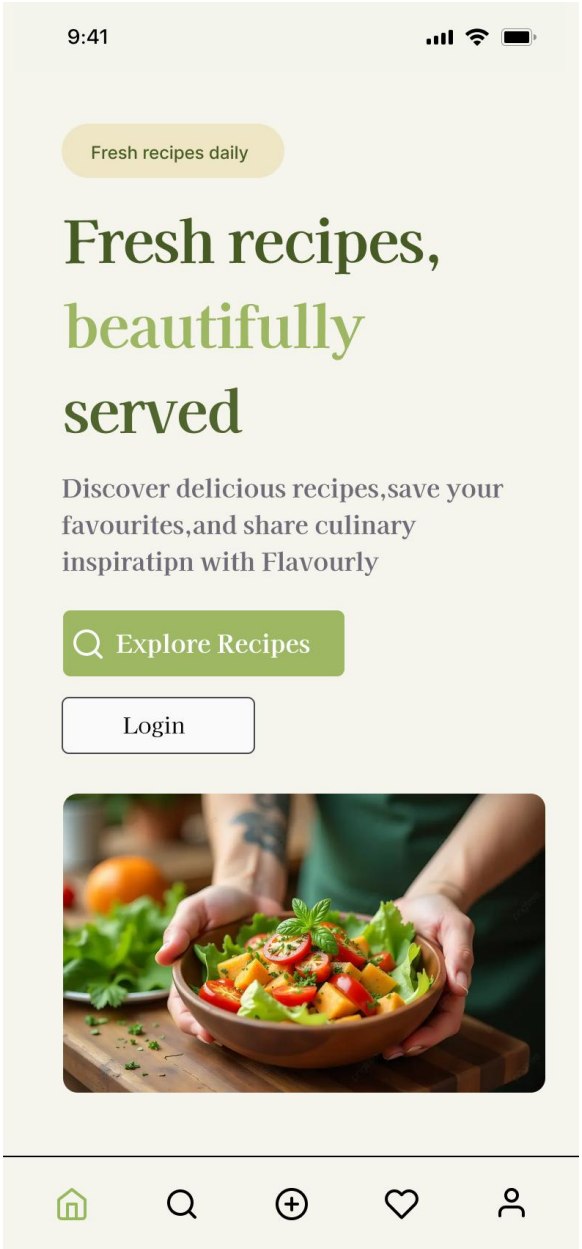
4. Description of the Storyboard

The storyboard represents the interaction between the user and the system across different stages:

- **Scenario 1: Initial Idea**
  User expresses the need for a recipe app based on ingredients.
  System suggests additional features like filters and categories.

- **Scenario 2: Feature Discussion**
  User requests favorites and step-by-step guidance.
  System includes features like saving recipes and shopping list generation.
- **Scenario 3: User Interface**
  User prefers a simple and clean UI.
  System proposes a visual layout with filters and scrollable feed.
- **Scenario 4: Account & Sync**
  User asks for syncing and offline access.
  System ensures cloud backup and offline availability.
- **Scenario 5: Testing & Launch**
  System undergoes usability testing with different user groups.

5. Low-Fidelity Prototype Design (Balsamiq)



Based on the storyboard, the following screens were designed:

- **Home Screen**
  - Search bar for ingredients
  - Recipe suggestions
- **Recipe List Screen**
  - Recipe cards with images

    - Filters (time, diet, category)
- **Recipe Detail Screen**
    - Step-by-step instructions
    - Save to favorites option
- **Favorites Screen**
    - Saved recipes list
- **Profile/Account Screen**
    - Sync settings
    - User preferences

6. Working Procedure

1. Identified user needs and defined the problem
2. Created storyboard to represent user-system interaction
3. Analyzed each scenario and mapped it to UI screens
4. Designed low-fidelity wireframes using Balsamiq
5. Reviewed the prototype for usability and simplicity

7. Result

A structured storyboard and corresponding low-fidelity prototype were successfully created, clearly representing the application flow and user interaction.

8. Conclusion

The storyboard helped in understanding user requirements and system behavior effectively. Using Balsamiq, these ideas were translated into simple UI designs, making it easier to visualize the final application.

9. Future Enhancements

- Add high-fidelity UI design (Figma)
- Implement backend and database
- Add AI-based recipe recommendations
